

Figure 1 consists of 12 electron micrographs arranged in two columns and six rows. The left column shows the morphology of poly(2-vinylpyridine) (P2VP), and the right column shows the morphology of poly(2-vinylpyridine-co-vinylcarbazole) (P2VPCoVC). The rows represent different stages of morphology: (a) initial morphology, (b) after treatment with THF, (c) after treatment with CH₂Cl₂, (d) after treatment with CHCl₃, (e) after treatment with CCl₄, and (f) after treatment with C₆H₆ and C₇H₈. The images show a variety of structures, including spheres, rods, and networks, which change as the solvents are applied.
